CELLUSTER INC.

Execution-Native Semantic Computing | Reflex Substrate | Distributed Systems Architecture

CERTIFICATE OF COMPLETION

VIDUSHI BHAR

has successfully completed the

CELLUSTER SUMMER INTERNSHIP PROGRAM - 2026

Domain Focus

HEALTHCARE | MEDICATION ADMINISTRATION / SAFETY-CRITICAL CLINICAL EXECUTION

Celluster is developing an execution-native semantic computing substrate in which authored intent becomes part of execution itself, together with identity, evidence, continuity, policy, resources, and bounded Reflex behavior.

Vidushi's internship investigated whether that execution model could meaningfully extend into Healthcare, a safety-critical domain where clinical judgment, institutional authority, systems of record, regulatory obligations, and distributed execution boundaries must remain explicitly separated.

Across the program, Vidushi progressed from current-state architecture research to:

Distributed Systems Architecture | Intent Discovery | Execution Semantics | Authority Boundary Discovery | Cell and Workload Boundary Discovery | Lifecycle Analysis | Evidence and Telemetry Modeling | Reflex Analysis | Domain-Specific DSL Design | Celluster Fit and Adoption Assessment

Her final assessment identified a meaningful Celluster fit in selected execution surfaces including interface integrity, release-boundary enforcement, evidence capture, and continuity verification, while explicitly preserving clinical judgment, institutional authority, regulatory authority, and vendor systems of record outside Celluster's authority.

Vidushi demonstrated the ability to distinguish what Celluster can execute, preserve, observe, enforce, and adapt from what must remain under clinical, institutional, regulatory, or external-system authority, an important architectural principle for applying Celluster beyond its initial AI infrastructure beachhead.
